Practice from Last Time

Write a program that asks the user when their birthday is (month and day of month as integers). Then print a message telling them if their birthday has already passed this year, is yet to come this year, or is today.
**Introduction to Functions**

- **Function**: group of statements within a program that perform as specific task
  - Usually one task of a large program
    - Functions can be executed in order to perform overall program task
    - Known as *divide and conquer* approach
- **Modularized program**: program wherein each task within the program is in its own function

**Benefits of Modularizing a Program with Functions**

- The benefits of using functions include:
  - Simpler code
  - Code reuse
    - Write the code once and call it multiple times
  - Better testing and debugging
    - Can test and debug each function individually
  - Faster development
  - Easier facilitation of teamwork
    - Different team members can write different functions

Defining a Function

Defining and Calling a Function

Calling a Function

The main() function

• To use a function, we must define it first.
• After defining a function, to run the code inside, you call the function.
  – When a function is called:
    • Interpreter jumps to the function and executes statements in the block
    • Interpreter jumps back to part of program that called the function

Defining a Function

• Syntax:

```
def name():
    statement
    statement
```

Pick a name for your function that describes what it does!
(Just like you pick variable names that describe what the variable holds.)

Calling a Function

• Syntax:

```
name()
```

After defining a function, you can call it any number of times you want.
Each time it is called Python acts as if you had typed in all of the lines of the function definition.

The main() function

• From this point on, always define a main() function in your programs.
• Always call the main() function as the last line in your program.
• main function: called when the program starts
  – Calls other functions when they are needed
  – Defines the mainline logic of the program
Indentation in Python

• Each block must be indented
  – Lines in block must begin with the same number of spaces
    • Use tabs or spaces to indent lines in a block, but not both as this can confuse the Python interpreter
    • IDLE automatically indents the lines in a block
  – Blank lines that appear in a block are ignored

Example with Functions

• When a function is called, Python will
  – “jump” to the first line of the function’s definition,
  – run all the lines of code inside the definition, then
  – “jump” back to the point where the function was called.

```python
1 def twinkle():
2     print("Twinkle twinkle little star")
3     print("How I wonder what you are")
4 def main():
5     twinkle() # Call (run) the twinkle function.
6     print("Up above the world so high")
7     print("Like a diamond in the sky")
8     twinkle() # Call the twinkle function again.
9     main() # Call main() to start the program.
```

Practice

• You are in charge of desserts at Thanksgiving dinner. You decide to make 2 pumpkin pies and 1 apple pie.
• Write a program that defines these functions:
  – make_apple() should print a description of how to make an apple pie
  – make_pumpkin() should print a description of how to make a pumpkin pie
  – main() should call make_apple() and make_pumpkin() appropriately to make all the pies.
• Don’t forget to call main() at the end of your code!

Next Time

• Local Variables & Functions that Take Arguments
• Section 5.4 - 5.6
