# COMP 141 Functions Rhodes College

## Practice from Last Time

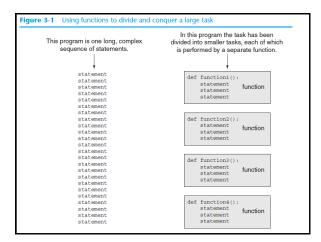

#### **Introduction to Functions**

- <u>Function</u>: group of statements within a program that perform as specific task
  - Usually one task of a large program
    - Functions can be executed in order to perform overall program task
  - Known as divide and conquer approach
- Modularized program: program wherein each task within the program is in its own function

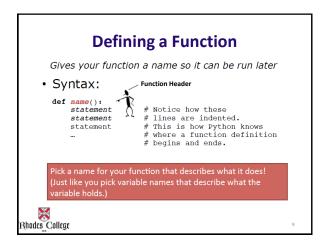

### Benefits of Modularizing a Program with Functions

- The benefits of using functions include:
  - Simpler code
  - Code reuse
    - write the code once and call it multiple times
  - Better testing and debugging
    - · Can test and debug each function individually
  - Faster development
  - Easier facilitation of teamwork
    - Different team members can write different functions

#### **Defining and Calling a Function**

- To use a function, we must *define* it first.
- After defining a function, to run the code inside, you call the function.
  - When a function is called:
    - Interpreter jumps to the function and executes statements in the block
    - Interpreter jumps back to part of program that called the function

#### **Calling a Function**

Runs the code inside the function definition

Syntax:

name()

After defining a function, you can call it any number of times

Each time it is called Python acts as if you had typed in all of the lines of the function definition.

#### The main () function

- From this point on, always define a main () function in your programs.
- Always *call* the main () function as the last line in your program.
- main function: called when the program starts
  - Calls other functions when they are needed
  - Defines the *mainline logic* of the program

3

#### **Indentation in Python**

- · Each block must be indented
  - Lines in block must begin with the same number of spaces
    - Use tabs or spaces to indent lines in a block, but not both as this can confuse the Python interpreter
    - IDLE automatically indents the lines in a block
  - Blank lines that appear in a block are ignored

#### **Example with Functions**

- When a function is called, Python will
  - "jump" to the first line of the function's definition,
  - run all the lines of code inside the definition, then
  - "jump" back to the point where the function was called.

```
1 def twinkle():
2 print("Twinkle twinkle little star")
3 print("How I wonder what you are")
4 def main():
5 twinkle() # Call (run) the twinkle function.
6 print("Up above the world so high")
7 print("Like a diamond in the sky")
8 twinkle() # Call the twinkle function again.
9 main() # Call main() to start the program.
```

#### **Practice**

- You are in charge of desserts at Thanksgiving dinner.
   You decide to make 2 pumpkin pies and 1 apple pie.
- Write a program that defines these functions:
  - make\_apple() should print a description of how to make an apple pie
  - make\_pumpkin() should print a description of how to make a pumpkin pie
  - main() should call make\_apple() and make\_pumpkin() appropriately to make all the pies.
- Don't forget to call main() at the end of your code!
