- Assignment 6
 - due Wed. Nov. 14th/Thurs. Nov. 15th

MapReduce Quiz Problem

Suppose our input data to a map-reduce operation consists of integer values (the keys are not important). The map function takes an integer i and produces the list of pairs (p,i) such that p is a prime divisor of i . For example, $\text{map}(12) = [(2,12), (3,12)]$. The reduce function is addition. That is, $\text{reduce}(p, [i, i, \dots, i])$ is $(p, i + i + \dots + i)$. Compute the output, if the input is the set of integers 15, 21, 24, 30, 49. Then, identify, in the list below, one of the pairs in the output.

- a. (7, 70)
- b. (5, 49)
- c. (2, 47)
- d. (6, 54)

3

PageRank: The Google Formulation

PageRank: Three Questions

$$r_j^{(t+1)} = \sum_{i \rightarrow j} \frac{r_i^{(t)}}{d_i} \quad \text{or equivalently} \quad r = Mr$$

- Does this converge?
- Does it converge to what we want?
- Are results reasonable?

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

5

Does this converge?

$$r_j^{(t+1)} = \sum_{i \rightarrow j} \frac{r_i^{(t)}}{d_i}$$

- Example:

$$\begin{matrix} r_a \\ r_b \end{matrix} = \begin{matrix} 1 & 0 & 1 & 0 \\ 0 & 1 & 0 & 1 \end{matrix}$$

Iteration 0, 1, 2, ...

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

6

Does it converge to what we want?

$$r_j^{(t+1)} = \sum_{i \rightarrow j} \frac{r_i^{(t)}}{d_i}$$

■ Example:

$$\begin{array}{c} r_a \\ r_b \end{array} = \begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{array}$$

Iteration 0, 1, 2, ...

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

7

PageRank: Problems

2 problems:

- (1) Some pages are **dead ends** (have no out-links)
 - Random walk has “nowhere” to go to
 - Such pages cause importance to “leak out”
- (2) **Spider traps:** (all out-links are within the group)
 - Random walked gets “stuck” in a trap
 - And eventually spider traps absorb all importance

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

8

Problem: Spider Traps

Power Iteration:

- Set $r_j = 1$
- $r_j = \sum_{i \rightarrow j} \frac{r_i}{d_i}$
- And iterate

	y	a	m
y	1/2	1/2	0
a	1/2	0	0
m	0	1/2	1

m is a spider trap

$$r_y = r_y/2 + r_a/2$$

$$r_a = r_y/2$$

$$r_m = r_a/2 + r_m$$

Example:

$$\begin{pmatrix} r_y \\ r_a \\ r_m \end{pmatrix} = \begin{pmatrix} 1/3 & 2/6 & 3/12 & 5/24 & & 0 \\ 1/3 & 1/6 & 2/12 & 3/24 & \dots & 0 \\ 1/3 & 3/6 & 7/12 & 16/24 & & 1 \end{pmatrix}$$

Iteration 0, 1, 2, ...

All the PageRank score gets "trapped" in node m.

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

9

Solution: Teleports!

The Google solution for spider traps: At each time step, the random surfer has two options

- With prob. β , follow a link at random
- With prob. $1-\beta$, jump to some random page
- Common values for β are in the range 0.8 to 0.9

Surfer will teleport out of spider trap within a few time steps

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

10

Problem: Dead Ends

Power Iteration:

- Set $r_j = 1$
- $r_j = \sum_{i \rightarrow j} \frac{r_i}{d_i}$
- And iterate

	y	a	m
y	1/2	1/2	0
a	1/2	0	0
m	0	1/2	0

$$r_y = r_y/2 + r_a/2$$

$$r_a = r_y/2$$

$$r_m = r_a/2$$

Example:

$$\begin{bmatrix} r_y \\ r_a \\ r_m \end{bmatrix} = \begin{bmatrix} 1/3 & 2/6 & 3/12 & 5/24 & & 0 \\ 1/3 & 1/6 & 2/12 & 3/24 & \dots & 0 \\ 1/3 & 1/6 & 1/12 & 2/24 & & 0 \end{bmatrix}$$

Iteration 0, 1, 2, ...

Here the PageRank "leaks" out since the matrix is not stochastic.

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

11

Solution: Always Teleport!

- **Teleports:** Follow random teleport links with probability 1.0 from dead-ends
- Adjust matrix accordingly

	y	a	m
y	1/2	1/2	0
a	1/2	0	0
m	0	1/2	0

	y	a	m
y	1/2	1/2	1/3
a	1/2	0	1/3
m	0	1/2	1/3

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

12

Why Teleports Solve the Problem?

Why are dead-ends and spider traps a problem and **why do teleports solve the problem?**

- **Spider-traps** are not a problem, but with traps PageRank scores are **not** what we want
 - **Solution:** Never get stuck in a spider trap by teleporting out of it in a finite number of steps
- **Dead-ends** are a problem
 - The matrix is not column stochastic so our initial assumptions are not met
 - **Solution:** Make matrix column stochastic by always teleporting when there is nowhere else to go

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

13

Solution: Random Teleports

- **Google's solution that does it all:**
At each step, random surfer has two options:
 - With probability β , follow a link at random
 - With probability $1-\beta$, jump to some random page
- **PageRank equation** [Brin-Page, 98]

$$r_j = \sum_{i \rightarrow j} \beta \frac{r_i}{d_i} + (1 - \beta) \frac{1}{N}$$

d_i ... out-degree of node i

This formulation assumes that M has no dead ends. We can either preprocess matrix M to remove all dead ends or explicitly follow random teleport links with probability 1.0 from dead-ends.

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

14

The Google Matrix

- **PageRank equation** [Brin-Page, '98]

$$r_j = \sum_{i \rightarrow j} \beta \frac{r_i}{d_i} + (1 - \beta) \frac{1}{N}$$

- **The Google Matrix A:**

$[1/N]_{N \times N} \dots N$ by N matrix
where all entries are $1/N$

$$A = \beta M + (1 - \beta) \begin{bmatrix} 1 \\ N \end{bmatrix}_{N \times N}$$

- **We have a recursive problem: $r = A \cdot r$**

And the Power method still works!

- **What is β ?**

- In practice $\beta = 0.8, 0.9$ (make 5 steps on avg., jump)

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

15

Random Teleports ($\beta = 0.8$)

$$0.8 \begin{bmatrix} 1/2 & 1/2 & 0 \\ 1/2 & 0 & 0 \\ 0 & 1/2 & 1 \end{bmatrix} + 0.2 \begin{bmatrix} 1/3 & 1/3 & 1/3 \\ 1/3 & 1/3 & 1/3 \\ 1/3 & 1/3 & 1/3 \end{bmatrix}$$

$$\begin{matrix} y \\ a \\ m \end{matrix} \begin{bmatrix} 7/15 & 7/15 & 1/15 \\ 7/15 & 1/15 & 1/15 \\ 1/15 & 7/15 & 13/15 \end{bmatrix}$$

A

y	=	1/3	0.33	0.24	0.26	7/33
a		1/3	0.20	0.20	0.18	5/33
m		1/3	0.46	0.52	0.56	21/33

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

16

Example Problem

Suppose we compute PageRank with a β of 0.7, and we introduce the additional constraint that the sum of the PageRanks of the three pages must be 3, to handle the problem that otherwise any multiple of a solution will also be a solution. Compute the PageRanks a , b , and c of the three pages A, B, and C, respectively. Then, identify from the list below, the true statement.

- a. $a + b = 1.025$
- b. $a + b = 0.705$
- c. $a + c = 2.035$
- d. $a + b = 0.55$

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

17

How do we actually compute the PageRank?

Computing Page Rank

- **Key step is matrix-vector multiplication**

- $r^{\text{new}} = A \cdot r^{\text{old}}$

- Easy if we have enough main memory to hold A , r^{old} , r^{new}

- **Say $N = 1$ billion pages**

- We need 4 bytes for each entry (say)

- 2 billion entries for vectors, approx 8GB

- **Matrix A has N^2 entries**

- 10^{18} is a large number!

$$A = \beta \cdot M + (1-\beta) [1/N]_{N \times N}$$

$$A = 0.8 \begin{bmatrix} 1/2 & 1/2 & 0 \\ 1/2 & 0 & 0 \\ 0 & 1/2 & 1 \end{bmatrix} + 0.2 \begin{bmatrix} 1/3 & 1/3 & 1/3 \\ 1/3 & 1/3 & 1/3 \\ 1/3 & 1/3 & 1/3 \end{bmatrix}$$

$$= \begin{bmatrix} 7/15 & 7/15 & 1/15 \\ 7/15 & 1/15 & 1/15 \\ 1/15 & 7/15 & 13/15 \end{bmatrix}$$

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

19

Matrix Formulation

- Suppose there are N pages

- Consider page i , with d_i out-links

- We have $M_{ji} = 1/d_i$ when $i \rightarrow j$
and $M_{ji} = 0$ otherwise

- **The random teleport is equivalent to:**

- Adding a **teleport link** from i to every other page and setting transition probability to $(1-\beta)/N$

- Reducing the probability of following each out-link from $1/d_i$ to β/d_i

- **Equivalent:** Tax each page a fraction $(1-\beta)$ of its score and redistribute evenly

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

20

Rearranging the Equation

- $\mathbf{r} = \mathbf{A} \cdot \mathbf{r}$, where $A_{ji} = \beta M_{ji} + \frac{1-\beta}{N}$
- $r_j = \sum_{i=1}^N A_{ji} \cdot r_i$
- $r_j = \sum_{i=1}^N \left[\beta M_{ji} + \frac{1-\beta}{N} \right] \cdot r_i$

$$= \sum_{i=1}^N \beta M_{ji} \cdot r_i + \frac{1-\beta}{N} \sum_{i=1}^N r_i$$

$$= \sum_{i=1}^N \beta M_{ji} \cdot r_i + \frac{1-\beta}{N} \quad \text{since } \sum r_i = 1$$
- So we get: $\mathbf{r} = \beta \mathbf{M} \cdot \mathbf{r} + \left[\frac{1-\beta}{N} \right]_N$

Note: Here we assumed \mathbf{M} has no dead-ends

$[x]_N \dots$ a vector of length N with all entries x

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

21

Sparse Matrix Formulation

- We just rearranged the **PageRank equation**

$$\mathbf{r} = \beta \mathbf{M} \cdot \mathbf{r} + \left[\frac{1-\beta}{N} \right]_N$$

- where $[(1-\beta)/N]_N$ is a vector with all N entries $(1-\beta)/N$
- \mathbf{M} is a **sparse matrix!** (with no dead-ends)
 - 10 links per node, approx $10N$ entries
- So in each iteration, we need to:
 - Compute $\mathbf{r}^{\text{new}} = \beta \mathbf{M} \cdot \mathbf{r}^{\text{old}}$
 - Add a constant value $(1-\beta)/N$ to each entry in \mathbf{r}^{new}
 - **Note if \mathbf{M} contains dead-ends then $\sum_j r_j^{\text{new}} < 1$ and we also have to renormalize \mathbf{r}^{new} so that it sums to 1**

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmids.org>

22

PageRank: The Complete Algorithm

- **Input: Graph G and parameter β**
 - Directed graph G (can have **spider traps** and **dead ends**)
 - Parameter β
- **Output: PageRank vector r^{new}**

- **Set:** $r_j^{old} = \frac{1}{N}$
- **repeat until convergence:** $\sum_j |r_j^{new} - r_j^{old}| > \epsilon$
 - $\forall j: r_j^{new} = \sum_{i \rightarrow j} \beta \frac{r_i^{old}}{d_i}$
 $r_j^{new} = 0$ if in-degree of j is 0
 - **Now re-insert the leaked PageRank:**
 $\forall j: r_j^{new} = r_j^{new} + \frac{1-S}{N}$ where: $S = \sum_j r_j^{new}$
 - $r^{old} = r^{new}$

If the graph has no dead-ends then the amount of leaked PageRank is $1-\beta$. But since we have dead-ends the amount of leaked PageRank may be larger. We have to explicitly account for it by computing S .

J. Leskovec, A. Rajaraman, J. Ullman: Mining of Massive Datasets, <http://www.mmds.org>

23
